Apple India: Customer, Channel & Festive Gifting Analytics

Insights & Recommendations

Vedant Gangrade · Data: 678,647 transactions, 27 Oct 2024 – 26 Oct 2026 · Tools: PostgreSQL, Python, Power BI

Summary. Revenue is driven by a few moments and a few customers. Festive periods sell up to **3× a normal day**, and **21% of customers bring 50% of revenue**. But **47.5% of customers have stopped buying**, and marketplaces win volume at the cost of discounts, returns and lower AppleCare+ attach. The biggest opportunities are festive planning, protecting Champions, timely win-back campaigns and steering buyers to Apple-owned channels.

Business problem

Leadership wants to know what drives revenue, who the most valuable customers are, and how festivals, sales channels and gifting shape sales, so they can plan festive campaigns, improve retention and choose the right channels.

Key numbers

₹4,121 Cr net revenue (after refunds)	**419,500** orders	**₹1.01 lakh** average order value
50% of revenue from Champions (21% of customers)	**47.5%** of customers churned (180+ days)	**3.1×** Diwali day vs a normal day

Findings & recommendations

#	Finding	Recommendation
1	**Festivals drive the business** Diwali days sell **3.1×** a normal day, and iPhone launch weeks **2.3×**; Christmas adds 1.4×. Oct 2025 alone brought ₹310 Cr, about double a typical month.	Plan stock, staffing and bank offers around these windows. Start Diwali campaigns 2–3 weeks earlier.
2	**A small group brings half the revenue** Champions are **21% of customers but 50% of revenue**: ~₹5.1 lakh average spend, ~6.7 orders, last purchase ~35 days ago.	Protect them with early launch access, priority service and exclusive offers.
3	**Nearly half of customers have gone quiet** Median repeat gap is **78 days**; 76% of repeat purchases happen within 180 days. **47.5%** have churned, including 24,441 At Risk customers averaging ₹1.4 lakh spend.	Run win-back campaigns at 120–150 days of inactivity, before customers cross the 180-day line. Prioritise At Risk.
4	**Marketplaces sell volume at a cost** Amazon and Flipkart: **~11% discount** and **~4.6% returns**, vs ~1.3% and ~2.3% on Apple channels. AppleCare+ attach **~6% vs ~22%**.	Steer buyers to Apple-owned channels with bundles, trade-ins and AppleCare+ offers. Use marketplaces mainly for Tier-2/3 reach.
5	**New stores win share fast** Apple Hebbal took **~24% of Bengaluru's retail revenue** in its first year, mostly from Apple Online and resellers.	Judge new stores on total city revenue, since they shift demand as well as create it.

#	Finding	Recommendation
6	**Payment depends on price** **UPI ~50%** of orders under ₹50K. **No-Cost EMI is #1 above ₹50K (~38%)**.	Keep EMI prominent for iPhone and Mac. Optimise UPI checkout for accessories and AirPods.
7	**Gifting is a major use case** **~39% of retail orders are gifts**, ~14% smaller than self-purchases (₹66K vs ₹77K), with no higher return rate. Anniversary → Partner is the top combination.	Run occasion-led campaigns (anniversaries, birthdays, weddings, Raksha Bandhan). Promote engraving and gift messages online.
8	**iPhone leads revenue, accessories lead volume** iPhone ≈ **38% of revenue**; accessories and AirPods sell the most units. Mumbai, Bengaluru and Delhi each bring ~₹510 Cr.	Bundle accessories at iPhone checkout to lift order value. Focus metro marketing on the top 3 cities.
9	**Timing for staff and campaigns** Stores peak **6–8 pm**, online **9–10 pm**. Weekends have the most orders; weekdays bring more revenue (corporate).	Add evening store staff. Send app and email campaigns in the late evening.

Top 3 priorities

1 **Festive readiness**
Lock Diwali and launch-week stock, staff and bank offers 2–3 weeks ahead: these windows sell 2–3× normal.

2 **Champion protection + win-back**
Keep the 21% who bring 50% of revenue, and contact At Risk customers before day 180.

3 **Channel mix**
Shift buyers from marketplaces to Apple channels to cut discounts and returns and raise AppleCare+ attach.

How this was done

PostgreSQL: loaded 678K rows, converted types, ran 18 business queries (CTEs, window functions, percentiles).
Python: RFM scoring (quintiles), 6 segments, a data-driven 180-day churn rule, results written back to PostgreSQL.
Power BI: star-style model, DAX measures with time intelligence, 5 interactive pages.

Limitations

Transactions are **synthetic** (real catalogue, prices and store dates; simulated customers and orders), so findings show the analysis method, not Apple's actual business. Oct 2024 is a partial month and Diwali 2026 falls after the data ends. Before/after comparisons are descriptive, not causal.
